✦ AI Overview

Feature flags, or feature toggles, are a software development technique that allows you to turn specific features "on" or "off" at runtime without redeploying code. You should use them to separate code deployment from feature release, enable gradual and controlled rollouts, test new features with real users, perform A/B testing, and provide a "kill switch" to quickly disable a problematic feature. This approach reduces risk, improves feedback loops, and supports continuous delivery models.
