

Extras

- Feature Flags?

The screenshot shows a dark-themed search interface with a navigation bar at the top. The navigation bar includes links for "AI Mode", "All", "Short videos", "Images", "Forums", "Videos", "Shopping", and "More". A search bar at the top contains the query "what are feature flags and why should I use them?". Below the search bar, the results are displayed under the heading "AI Overview". The main result is a detailed text about feature flags, which is highlighted with blue boxes around key phrases like "software development technique", "turn specific features", "on" or "off", "redeploying code", and "kill switch". To the right of the main text, there is a small thumbnail image for a video titled "Feature Flags: What They Are and How to Use Them" by "TechSmith".

AI Overview

Feature flags, or feature toggles, are a software development technique that allows you to turn specific features "on" or "off" at runtime without redeploying code. You should use them to separate code deployment from feature release, enable gradual and controlled rollouts, test new features with real users, perform A/B testing, and provide a "kill switch" to quickly disable a problematic feature. This approach reduces risk, improves feedback loops, and supports continuous delivery models.
